

IMPROVED DESIGN

*Storm valve angled
Art. no. 159301*

*Storm valve straight
Art. no. 159801*

LK Valves now introduce a new and improved range of Storm valves. The new valve, which is designed, developed and produced in-house, will be available in sizes DN50 – DN150, in straight and angled execution, and features several innovative improvements.

NEW FEATURES

- By removing the counter weight and replacing it with a spring we have reduced the product weight by 40% compared to equivalent products on the market.
- We have borrowed the technology of vulcanized butterfly valves to also vulcanize the disc of the storm valve. This give a reliable and resilient sealing.
- By avoiding the traditional tilted seat we have managed to increase the flow by 10%.
- Now compliant with IHM/Green passport by removing the lead-filled counter weight.
- Critical parts placed outside of media for protection against corrosion, easy inspection and maintenance.
- Easier to handle and operate in tight places.
- Available with product class certificates.
- Straight and angled execution, DN50 - DN150.

A VALVE IS NEVER JUST A VALVE

The new storm valve is produced in our own production facility, to ensure it meets our high LK quality standard during the entire production process.

LK Valves has a unique business model where we are directly involved in the design, development, production, sales, contract management and logistics. By interacting with our customers at each and every step of the way, we have an opportunity of adding value to our customers and deliver quality by understanding their needs. Remember that a valve is never just a valve.
